

CS 2341

Chapter 4

Trees

This is a 3-ary tree

$$\# \text{ of edges} = N - 1$$

\uparrow
 $\# \text{ of nodes}$

Binary Tree (2-ary tree)

avg. depth $\approx \sqrt{N}$ (for random trees)

\uparrow
of nodes

Bad Binary Tree

depth:

$d = N - 1$!
 $\rightarrow O(N)$
like a
linked
list!

Tree Traversal

Depth-first traversal

NLR (pre-order t.): 1, 2, 4, 3, 5, 7, 6

LNR (in-order t.): 4, 2, 1, 7, 5, 3, 6

LRN (post-order t.): 4, 2, 7, 5, 6, 3, 1

Breadth-first traversal

1, 2, 3, 4, 5, 6, 7

Expression tree from postfix notation

Example: 6 5 2 3 + 8 * + 3 + *

- number \rightarrow stack
- operator: pop \geq numbers
- make a subtree
- put pointer to subtree on stack

In-order traversal of the Expression tree
(L) N (R) \rightarrow infix notation

$$(6) * (15) + ((2+3) * 8) + 3$$

$$= 6 * (5 + (2+3) * 8 + 3)$$

Post-order traversal LRN \rightarrow postfix notation

$$6 \ 5 \ 2 \ 3 \ + \ 8 \ * \ + \ 3 \ + \ *$$

Binary Tree

$$L < N < R$$
$$9 \times 8 < 10$$

Binary Search Tree

order property: $L < N < R$

$$L < N < R$$
$$8 < 9 < 10 \checkmark$$

Insert into Binary Search Tree + Delete

insert: 12, 90, 3, 5, 18, 9, 99, 91

Delete 3
Case B
⇒

Delete 90
Case C
Steps

1. unlink 91
2. relink in place of 90
3. delete node 90

Delete 90
Case C
⇒

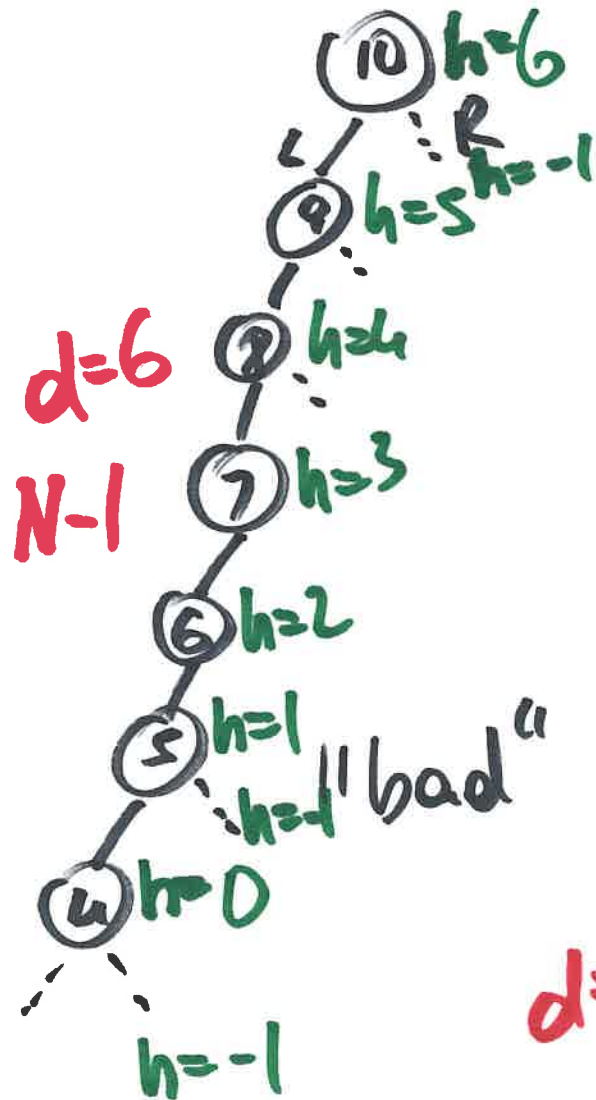

delete: 3, 90

in order traversal (LNR): 5, 9, 12, 18, 91, 99

B. Search Trees & Balance

insert: 10, 9, 8, 7, 6, 5, 4

?

\Rightarrow

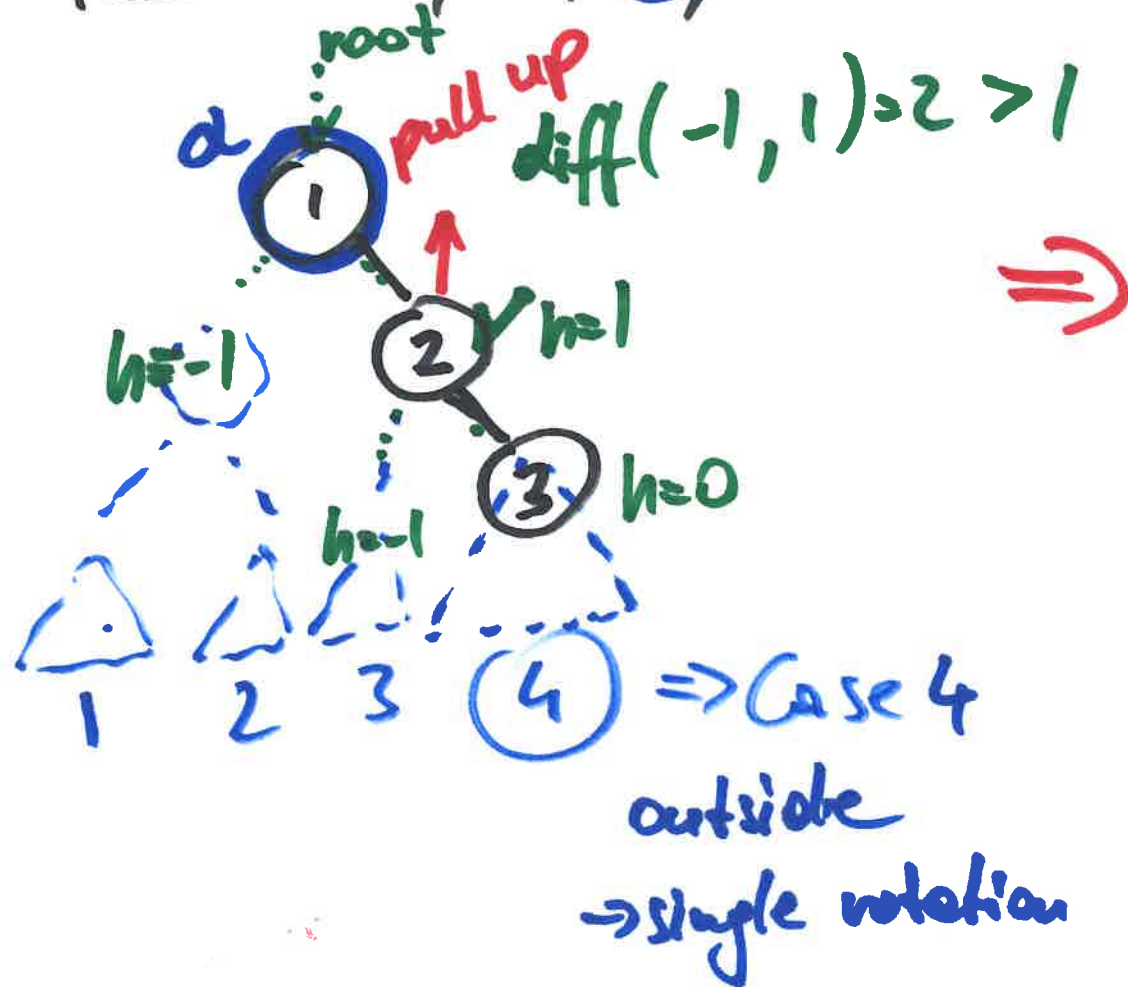

"good"

$$d = \log_2(N+1) - 1 = 3 - 1 = 2$$

AVL Tree

insert: 1, 2, 3, 4

AVL Tree

insert: 5, 1, 6, 3, **2**

inside → double rotation

1. find insertion point
2. do insertion
3. balance

Why to pass a reference to a pointer?

→ to change the pointer in the calling function

void insul(cast

insul(10, root)

insul(100, root)

int &x, Binary Node * &t

function just wants to look at "x"

no const!!!
= function wants to change t!!!
Binary Node * &t

Time Complexity of an AVL Tree

insert: $O(\text{find}) + O(\text{add to tree}) + O(\text{balance})$
 $O(\log N) + O(1) + O(1)$
 $O(d) \Rightarrow O(\log N)$

delete: $O(\log N)$

Binary Tree Search : find 1

Binary Search : find 1

representation
of a binary tree
as an array

is equivalent

MAP

one-to-one mapping : bijection

Implementation : add a value member variable to the node class
